We present a case of renal failure secondary to renal limited PR-3 ANCA vasculitis, needing dialysis, where successful induction and maintenance of remission was achieved through the use of Mycophenolate Mofetil. An 87 year old female patient presented to the Nephrology service with renal failure, hematuria and proteinuria. Subsequently, she was diagnosed with PR-3 anti-neutrophil cytoplasmic antibody-associated crescentic glomerulonephritis on renal biopsy. She was treated with MMF along with plasmapheresis and 8-months since the diagnosis she has been in complete remission and continues to be on maintenance dose of MMF and oral steroids.
